RE: Oil Transfer System

To Whom It May Concern:

Lightning Ventures is a large commercial excavation company located in the Denver Colorado area. We have a fleet of approximately 70 Mack trucks and 125 pieces of Caterpillar equipment.

On or about April 20th2005, the owner of Lightning Ventures, Anthony Falcone introduced me to a friend of his Brent Willing who at that time was just getting into the oil transfer system business. Brent was telling me how I could clean used hydraulic oil and save money. I was very skeptical thinking all this was going to do was make more work for my mechanics. With the price of hydraulic oil at approximately \$5.00 per gallon, it was worth a try.

I was surprised and impressed. I had a hydraulic pump failure where the ISO pump partial count was up to 22/16. After running the hydraulic oil through the oil transfer system, my ISO partial count went down to 18/15, which made this oil reusable.

With further use of this system, we looked into cleaning our new 15W/40 bulk engine oil. Our new oil is coming out of bulk tanks and had an ISO of 21/18. After cleaning our ISO was 19/14 by cleaning our new oil, I am expecting to increase the life of our engines and all components. Our used oil is also utilized to heat our 18,000 foot shop. Dirty oil problems have caused filter plugging and various other issues. Using Mr. Willing's system, our used oil has become cleaner and eliminated many of the furnace problems.

This system is easy to use. The time it takes to clean oil and reuse is cost effective and will definitely save this company money.
